José ADJOVI

Full-stack web and mobile developer

Abomey-Calavi, Benin · Remote · joseadjovi67@gmail.com · +229 01 53 22 53 24

Profile

I am a full-stack web and mobile developer. I design applications and platforms and take them through to production. For several years I have worked remotely with teams in Belgium, Côte d'Ivoire, Canada and Benin. The contexts change. The way of working does not: understand the need, choose an architecture that will hold, and ship something other people can maintain.

Skills

Next.js, React, Vue.js, Node.js, Laravel, Flutter, Firebase, MySQL and Git. I host and release on a VPS. I build interfaces, APIs and mobile apps, and I connect those pieces when the product needs them to work as one.

Experience

WhaMak — Founder

SaaS for managing WhatsApp conversations

I am building WhaMak, a product for companies that want to centralize their WhatsApp conversations. The work covers architecture, the back end, the interfaces, API integrations, VPS hosting and production. It is a founder's job: the technical decisions and the responsibility for the live service sit with me.

Agropaire — Brussels

Marketplace: website, seller app, courier app

I took part in a marketplace that brought together a website, an application for sellers and an application for couriers. The point was to hold different journeys together, for users who do not do the same job.

Wappii — Development team lead

Multi-service platform

I coordinated a development team around a multi-service platform. The role asked me to keep the whole product in view, to make technical choices explicit, and to deliver one coherent system rather than a pile of features.

Other remote work

I have also worked remotely for O'cabs in Abidjan, for Mille Cervo, and on Enfami Soccer, Ruche CI and Aidomiz. Those engagements came with different timelines, users and constraints. They confirmed that I can move a product forward without sitting in the same office, as long as I write clearly and raise blockers early.

How I work

I do not separate development from going live. When a subject needs an owner, I take it from understanding the need through to production. I write down the decisions that matter, I reread what I ship, and I prefer a simple maintainable solution to a stack of features that are hard to take over.

Remote work is my usual setting. I am used to written exchanges, to teams in different places, and to products that have to keep running when everyone is not online at once. French is my working language. I write professional English when the team needs it.

What I am looking for

A full-time remote role as a full-stack web and mobile developer, where Next.js, React, Vue.js, Node.js, Laravel or Flutter serve a real product. I am based in Abomey-Calavi.
